Funnel Stage Distribution

Conversion Rate by Channel

Campaign Spend vs. Attributed Revenue

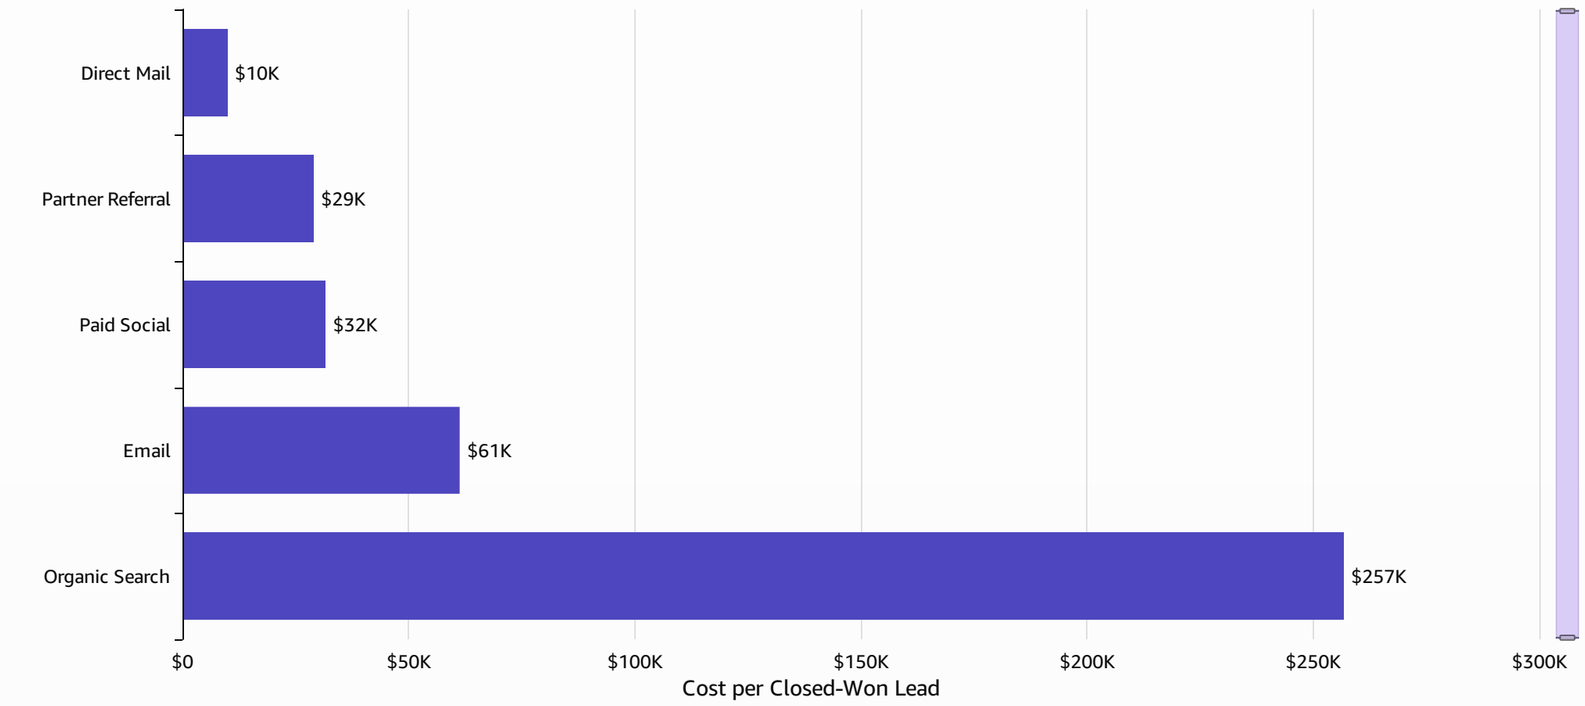

Reported campaign ROI is negative for all six campaigns, from −83.7% to −97.7%. Treat these as a ranking, not as profitability.

The marketing platform charges a fully-loaded cost to every one of the 2,240 touchpoints ($12.4M total) but credits revenue only to the 609 that converted ($1.13M). Against that, the CRM records $707,201 of actual closed-won revenue for the same period — so the two systems disagree about marketing's contribution by a factor of 1.6.

Action: use the ranking to allocate — NovaPulse Launch is the strongest campaign on every measure (33.7% conversion, $963 revenue per lead, best ROI) and NovaEdge Awareness the weakest (5.1%, $126, worst ROI). Then commission Marketing Ops to reconcile the attribution model against CRM closed-won revenue before ROI is quoted in any board material.

Cost per Closed-Won Lead by Channel

Direct Mail converts 49% of leads to closed-won business at $9,881 per win. Organic Search converts 0.9% at $256,709 per win — 26 times more expensive.

Organic Search absorbs 671 leads, the second-largest volume of any channel, and returns six closed deals. Direct Mail handles a fifth of that volume and returns 73.

Action: shift budget from Organic Search into Direct Mail and Partner Referral for the next two quarters, and set a floor of 20% closed-won conversion for any channel to keep its funding. Before cutting Organic Search entirely, confirm with Marketing whether it is intended as a top-of-funnel awareness channel scored on a different metric — its 294 Prospect-stage leads suggest it may be.

Why We Lose Deals

Win / Loss by Sales Region

Win Rate by Sales Manager

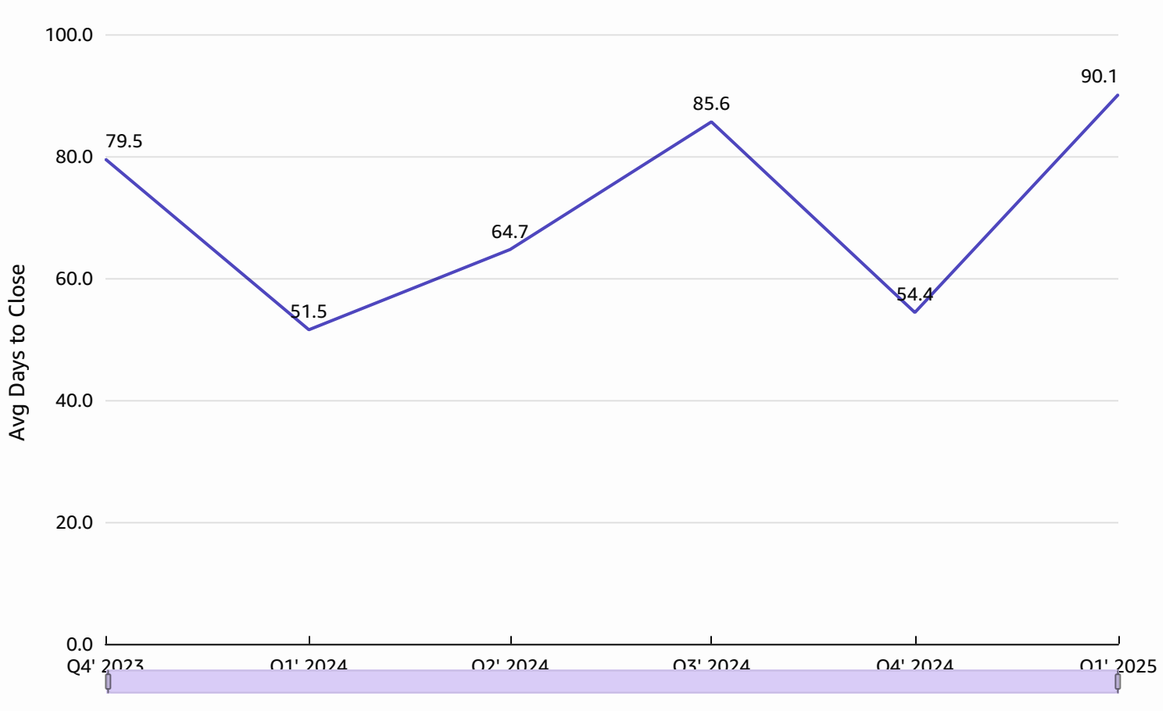

Win rates range from 70.8% to 50.0% across the six sales managers — a 20.8-point spread on comparable deal volumes.

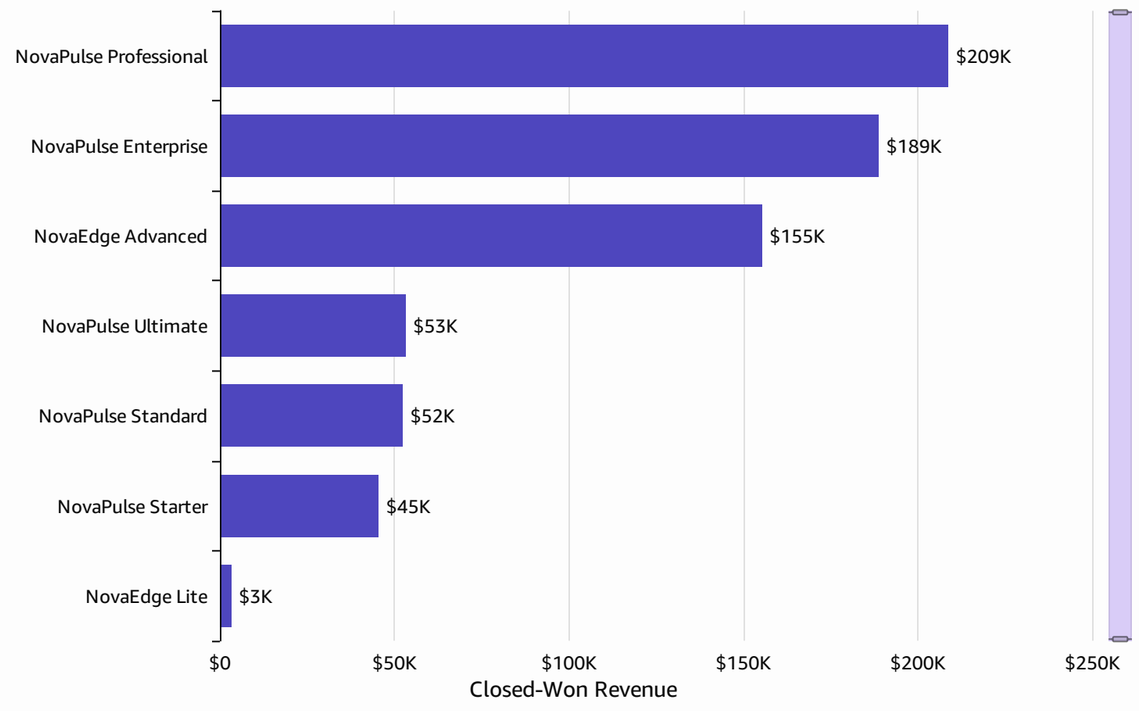

David Kim closes 80 of 113 deals (70.8%, $174,158). Brian Nakamura closes 46 of 92 (50.0%, $103,168) on a similar book. The gap is not explained by deal size: both teams average close to the company's $2,245 won-deal value. The same pattern shows by region, where Central runs 69.9% against East at 57.8%.

Action: run a win/loss review across Brian Nakamura's and Michael Chen's teams (51.4%) against David Kim's, focused on the two largest loss reasons — No Decision Made (43 deals) and Poor Product Fit (43). Together those are 47% of all losses and both are qualification problems, not pricing ones. Closing half the gap on those two teams is worth roughly 17 additional wins over the 19 months measured — about 10 a year.

Top Accounts by Support Ticket Volume

Ticket Volume and Sentiment by Product Area

Resolution Time by Priority

Critical tickets are resolved in 56.1 hours on average. Low-priority tickets take 58.9 hours. Priority is being recorded but is not driving triage.

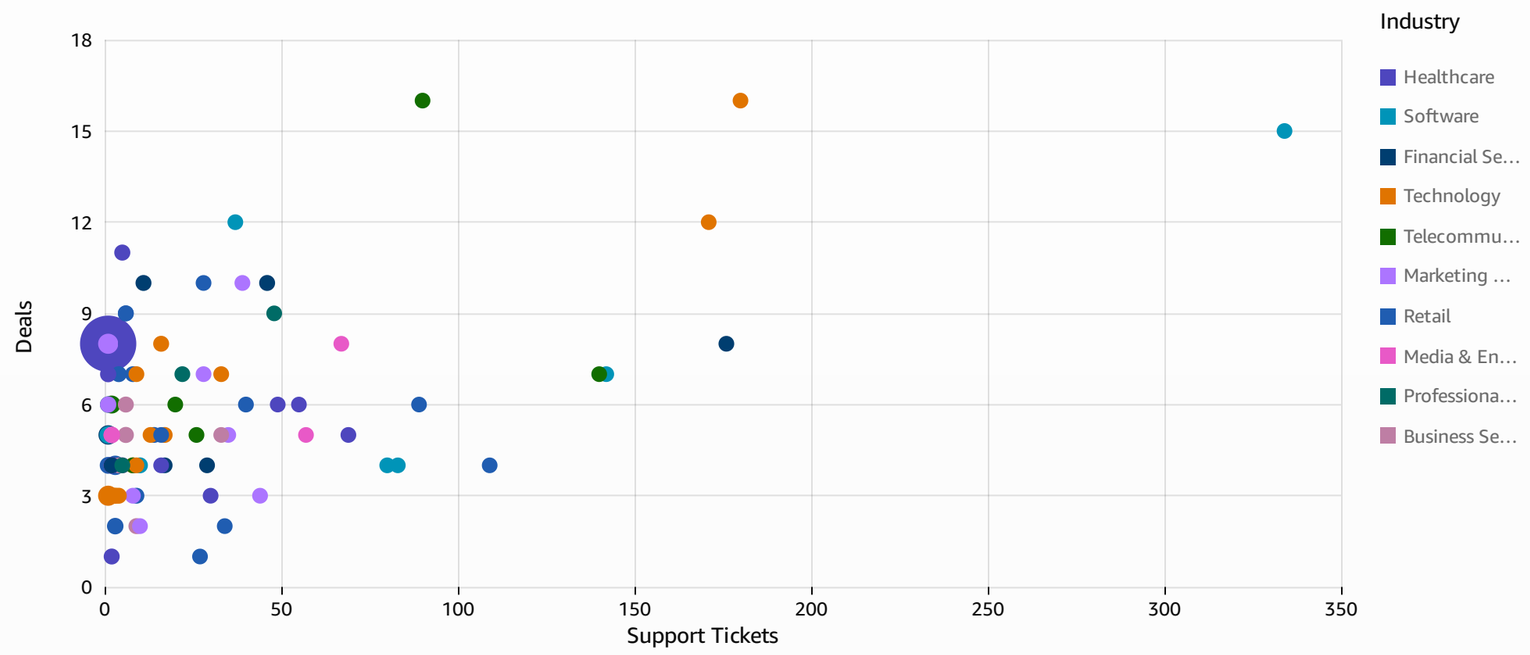

A 2.8-hour difference across a four-level severity scale means a customer reporting a system-down incident waits essentially as long as one asking a routine question. Critical and high-priority tickets also carry the worst sentiment of any severity level — 28.0% and 28.7% negative, against 20.6% for low. Forty-one tickets in the dataset affected payment processing.

Action: introduce priority-based SLA targets — a suggested 8 hours for critical and 24 for high — and route critical tickets to a dedicated queue rather than the shared backlog. This is the cheapest change in the dashboard: a routing rule, not headcount, addressing the 50 tickets most likely to trigger a churn conversation.

This finding is easy to read backwards. Asked to compare these same two numbers, Quick Chat concluded the small gap "suggests critical tickets may be getting prioritized appropriately." The figures it used were correct; the interpretation was the reverse of the truth. A near-flat result across a severity scale is evidence the scale is not working, not evidence that it is.

Account Risk: Deals vs. Support Burden

SHOWING UP TO 2500 DATA POINTS

Our biggest customers are our biggest support burden. Account revenue and ticket volume correlate at +0.59, and the ten highest-risk accounts hold $182,814 — 25.9% of all closed-won revenue.

YieldMax Software (ACCT-041) is the clearest case: 334 tickets, 11.1% of everything the support team handles, against $40,722 of revenue, 5.8% of the company total. Falcon Software (ACCT-011) files fewer tickets but 40.5% of them carry negative sentiment, on $20,912 of revenue. Six accounts sit above 100 tickets each.

Action: stand up a named-account success programme for the top ten by combined revenue and ticket load, with a quarterly business review and a named support contact. A quarter of the revenue base currently has no early-warning mechanism at all — this dashboard is the first place these accounts have appeared together.

One caveat before acting: SapphireCode Software (ACCT-083) files 80 tickets at 31.3% negative sentiment but has no closed-won revenue at all. There is nothing to lose there, which is why it is not on the priority list.
